## Question:

Find the equation of the plane passing through the intersection of the planes

$$(r) \cdot (\hat{i} + \hat{j} + \hat{k}) = 1$$

and

$$(r) \cdot (2\hat{i} + 3\hat{j} - \hat{k}) + 4 = 0$$

and parallel to the  $X$ -axis. Hence, find the distance of the plane from the  $X$ -axis.

## Solution:

Let the equations of the given planes be:

$$(r) \cdot (\hat{i} + \hat{j} + \hat{k}) = 1 \quad (1)$$

$$(r) \cdot (2\hat{i} + 3\hat{j} - \hat{k}) = 4 \quad (2)$$

Any plane passing through their intersection can be written as:

$$(r) \cdot (\hat{i} + \hat{j} + \hat{k}) - 1 + \lambda ((r) \cdot (2\hat{i} + 3\hat{j} - \hat{k}) - 4) = 0 \quad (3)$$

Expanding:

$$((\hat{i} + \hat{j} + \hat{k}) + \lambda(2\hat{i} + 3\hat{j} - \hat{k})) \cdot (r) = 1 + 4\lambda \quad (4)$$

The normal vector of the plane is:

$$(N) = (1 + 2\lambda)\hat{i} + (1 + 3\lambda)\hat{j} + (1 - \lambda)\hat{k} \quad (5)$$

## Solution:

Since the plane is parallel to the X-axis, its normal must be perpendicular to the X-axis:

$$1 + 2\lambda = 0 \implies \lambda = -\frac{1}{2} \quad (6)$$

Substitute  $\lambda = -\frac{1}{2}$ :

$$(N) = 0 \cdot \hat{i} + \left(1 + 3\left(-\frac{1}{2}\right)\right) \hat{j} + \left(1 - \left(-\frac{1}{2}\right)\right) \hat{k} = -\frac{1}{2}\hat{j} + \frac{3}{2}\hat{k} \quad (7)$$

Equation of the plane:

$$-\frac{1}{2}y + \frac{3}{2}z = 1 + 4\left(-\frac{1}{2}\right) = -1 \quad (8)$$

$$-\frac{1}{2}y + \frac{3}{2}z + 1 = 0 \implies -y + 3z + 2 = 0 \quad (9)$$

## Solution:

The X-axis is the line  $y = 0, z = 0$ .

Distance from the plane to the X-axis (taking point  $(0, 0, 0)$ ) is:

$$D = \frac{|-0 + 3 \cdot 0 + 2|}{\sqrt{(-1)^2 + 3^2}} = \frac{2}{\sqrt{10}} \quad (10)$$

- Required plane:  $-y + 3z + 2 = 0$
- Distance from X-axis:  $\frac{2}{\sqrt{10}}$

# Python Code

```
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D

# Plane:  $y - 3z + 6 = 0 \Rightarrow y = 3z - 6$ 
# Create grid for plane
z = np.linspace(-5, 5, 20)
x = np.linspace(-5, 5, 20)
X, Z = np.meshgrid(x, z)
Y = 3*Z - 6

# Create figure
fig = plt.figure(figsize=(10,7))
ax = fig.add_subplot(111, projection='3d')
ax.plot_surface(X, Y, Z, alpha=0.5, color='cyan', rstride=1,
               cstride=1, edgecolor='k')
```

# Python Code

```
# Plot X-axis (y=0, z=0)
ax.plot([-5,5],[0,0],[0,0], color='red', linewidth=2, label='X-
axis')

# Point on X-axis (origin)
origin = np.array([0,0,0])

# Distance point on plane from origin (perpendicular foot)
# Plane: 0*x + 1*y - 3*z + 6 = 0 => normal = (0,1,-3)
normal = np.array([0,1,-3])
d = 6

# Formula for projection of origin onto plane
t = -(np.dot(normal, origin) + d) / np.dot(normal, normal)
foot = origin + t*normal

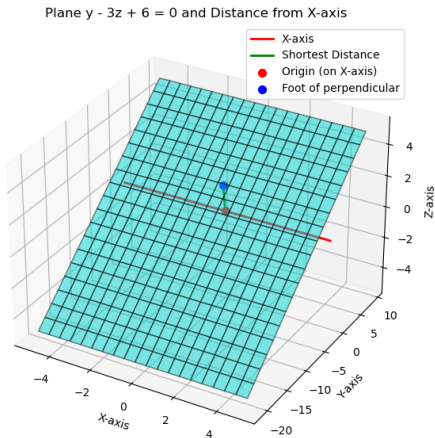

# Plot perpendicular distance line
ax.plot([origin[0], foot[0]], [origin[1], foot[1]], [origin[2],
foot[2]],
```

```
        color='green', linewidth=2, label='Shortest Distance')
# Plot origin and foot point
ax.scatter(*origin, color='red', s=50, label='Origin (on X-axis)'
)
ax.scatter(*foot, color='blue', s=50, label='Foot of
perpendicular')

# Labels
ax.set_xlabel('X-axis')
