Question: Find the coordinates of the focus, vertex, eccentricity, axis of the conic section, the equation of the directrix and the length of the latus rectum. $16x^2 + y^2 = 16$

Solution:

We use an affine transformation to convert the conic equation to its standard form.

$$\mathbf{x}^\top \mathbf{V} \mathbf{x} + 2\mathbf{u}^\top \mathbf{x} + f = 0 \quad (0.1)$$

The symmetric matrix \mathbf{V} is spectrally decomposed to align axes with eigenvectors.

$$\mathbf{V} = \mathbf{P} \mathbf{D} \mathbf{P}^\top, \quad \mathbf{D} = \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix}, \quad \mathbf{P}^\top \mathbf{P} = \mathbf{I} \quad (0.2)$$

Substituting the decomposition into the conic equation.

$$\mathbf{x}^\top \mathbf{P} \mathbf{D} \mathbf{P}^\top \mathbf{x} + 2\mathbf{u}^\top \mathbf{x} + f = 0 \quad (0.3)$$

A rotation

$$\mathbf{x}_r = \mathbf{P}^\top \mathbf{x} \quad (0.4)$$

aligns the conic with the coordinate axes.

$$\mathbf{x} = \mathbf{P} \mathbf{x}_r \quad (0.5)$$

Applying the rotation to the conic equation.

$$(\mathbf{P} \mathbf{x}_r)^\top \mathbf{P} \mathbf{D} \mathbf{P}^\top (\mathbf{P} \mathbf{x}_r) + 2\mathbf{u}^\top (\mathbf{P} \mathbf{x}_r) + f = 0 \quad (0.6)$$

$$\mathbf{x}_r^\top \mathbf{P}^\top \mathbf{P} \mathbf{D} \mathbf{P}^\top \mathbf{P} \mathbf{x}_r + 2(\mathbf{P}^\top \mathbf{u})^\top \mathbf{x}_r + f = 0 \quad (0.7)$$

$$\mathbf{x}_r^\top \mathbf{D} \mathbf{x}_r + 2\mathbf{u}_r^\top \mathbf{x}_r + f = 0 \quad (0.8)$$

A translation

$$\mathbf{x}_c = \mathbf{x}_r + \mathbf{D}^{-1} \mathbf{u}_r \quad (0.9)$$

moves the conic's center to the origin.

$$f_c = f - \mathbf{u}_r^\top \mathbf{D}^{-1} \mathbf{u}_r \quad (0.10)$$

The center of the conic in the original coordinates is

$$\mathbf{c} = -\mathbf{V}^{-1} \mathbf{u} \quad (0.11)$$

$$\mathbf{c} = -(\mathbf{P} \mathbf{D} \mathbf{P}^\top)^{-1} \mathbf{u} = -\mathbf{P} \mathbf{D}^{-1} \mathbf{P}^\top \mathbf{u} = -\mathbf{P} \mathbf{D}^{-1} \mathbf{u}_r \quad (0.12)$$

The complete transformation from original to centered coordinates is

$$\mathbf{x}_c = \mathbf{P}^\top (\mathbf{x} - \mathbf{c}) \quad (0.13)$$

$$\mathbf{x}_c = \mathbf{P}^\top \mathbf{x} + \mathbf{D}^{-1} \mathbf{u}_r = \mathbf{P}^\top \mathbf{x} - \mathbf{P}^\top \mathbf{c} = \mathbf{P}^\top (\mathbf{x} - \mathbf{c}) \quad (0.14)$$

$$\implies \mathbf{x} = \mathbf{P} \mathbf{x}_c + \mathbf{c} \quad (0.15)$$

The given conic equation

$$16x^2 + y^2 = 16 \quad (0.16)$$

$$\frac{16x^2}{16} + \frac{y^2}{16} = \frac{16}{16} \quad (0.17)$$

$$\frac{x^2}{1} + \frac{y^2}{16} = 1 \quad (0.18)$$

$$\mathbf{V} = \begin{pmatrix} 1 & 0 \\ 0 & \frac{1}{16} \end{pmatrix}, \quad \mathbf{u} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}, \quad f = -1 \quad (0.19)$$

The major axis corresponds to smaller eigenvalue.

$$\lambda_1 = \frac{1}{16}, \quad \lambda_2 = 1, \quad \mathbf{P} = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \mathbf{c} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \quad (0.20)$$

Applying the rotation to find the canonical coordinates.

$$\mathbf{x}_c = \mathbf{P}^\top \mathbf{x} \implies \begin{pmatrix} x_c \\ y_c \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} y \\ x \end{pmatrix} \quad (0.21)$$

The standard form of the ellipse in canonical coordinates.

$$\frac{x_c^2}{-f/\lambda_1} + \frac{y_c^2}{-f/\lambda_2} = 1 \quad (0.22)$$

$$e = \sqrt{1 - \frac{\lambda_1}{\lambda_2}} = \frac{\sqrt{15}}{4} \quad (0.23)$$

$$\mathbf{f}_c = \pm \sqrt{\frac{f(\lambda_1 - \lambda_2)}{\lambda_1 \lambda_2}} \mathbf{e}_1 = \pm \sqrt{15} \mathbf{e}_1 \quad (0.24)$$

$$\mathbf{v}_c = \pm \sqrt{\frac{-f}{\lambda_1}} \mathbf{e}_1 = \pm 4 \mathbf{e}_1 \quad (0.25)$$

$$\mathbf{d}_c : \mathbf{e}_1^\top \mathbf{x}_c = \pm \sqrt{\frac{-f \lambda_2}{\lambda_1 (\lambda_2 - \lambda_1)}} \pm \frac{16}{\sqrt{15}} \quad (0.26)$$

$$L = \frac{-2f}{\lambda_2} \sqrt{\frac{\lambda_1}{-f}} = \frac{1}{2} \quad (0.27)$$

Transforming properties back to the original coordinate system using (0.15)

$$\mathbf{f} = \mathbf{P}(\pm \sqrt{15}\mathbf{e}_1) = \pm \sqrt{15}\mathbf{e}_2 \quad (0.28)$$

$$\mathbf{v} = \mathbf{P}(\pm 4\mathbf{e}_1) = \pm 4\mathbf{e}_2 \quad (0.29)$$

$$\mathbf{d} : \mathbf{e}_2^\top \mathbf{x} = \pm \frac{16}{\sqrt{15}} \implies \begin{pmatrix} 0 & 1 \end{pmatrix} \mathbf{x} = \pm \frac{16}{\sqrt{15}} \quad (0.30)$$

Property	Value
Eccentricity	$\frac{\sqrt{15}}{4}$
Axis	$x = 0$
Vertices	$(0, \pm 4)$
Foci	$(0, \pm \sqrt{15})$
Directrices	$y = \pm \frac{16}{\sqrt{15}}$
Latus Rectum	$\frac{1}{2}$
