Question

P_1, P_2 are points on either of the two lines $y - \sqrt{3}|x| = 2$ at a distance of 5 units from their point of intersection. Find the coordinates of the foot of the perpendiculars drawn from P_1, P_2 on the bisector of the angle between the given lines.

Solution

The equation of the lines is :

$$y - \sqrt{3}x = \begin{bmatrix} -\sqrt{3} & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = 2 \quad (1)$$

$$y + \sqrt{3}x = \begin{bmatrix} \sqrt{3} & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = 2 \quad (2)$$

Combining both the equations 0.1 and 0.2 ,we get :

$$\begin{bmatrix} -\sqrt{3} & 1 \\ \sqrt{3} & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \end{bmatrix} \quad (3)$$

Solving by row reduction we get :

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 2 \end{bmatrix} \quad (4)$$

Solution

The equation for the point \mathbf{P}_1 are:

$$[-\sqrt{3} \quad 1] \mathbf{P}_1 = 2 \quad (5)$$

$$\|x \quad y - 2\| = 5 \quad (6)$$

The equation for the point \mathbf{P}_2 are:

$$[\sqrt{3} \quad 1] \mathbf{P}_1 = 2 \quad (7)$$

$$\|x \quad y - 2\| = 5 \quad (8)$$

Solving the equations we get :

$$\mathbf{P}_1 = \begin{bmatrix} \frac{5}{2} \\ 2 + \frac{5\sqrt{3}}{2} \end{bmatrix} \quad (9)$$

$$\mathbf{P}_2 = \begin{bmatrix} -\frac{5}{2} \\ 2 - \frac{5\sqrt{3}}{2} \end{bmatrix} \quad (10)$$

Solution

The equation of the angle bisector is given by

Let us take a point \mathbf{P} on the angle bisector, substitution it in the line equations and equating the angles we get the equation :

$$\frac{|n_1 \mathbf{P} - 2|}{\|n_1\|} = \frac{|n_2 \mathbf{P} - 2|}{\|n_1\|} \quad (11)$$

$$\frac{n_1 \mathbf{P} - 2}{\|n_1\|} \pm \frac{n_2 \mathbf{P} - 2}{\|n_1\|} = 0 \quad (12)$$

solving the above equation we get locus of \vec{P} as two lines which are the angle bisectors :

$$\begin{bmatrix} 1 \\ 0 \end{bmatrix}^T \mathbf{x} = 0 \quad (13)$$

$$\begin{bmatrix} 0 \\ 1 \end{bmatrix}^T \mathbf{x} = 2 \quad (14)$$

Solution

Let Q be the foot of the perpendicular from P to the line

$$\mathbf{n}^T \mathbf{x} = c \quad (15)$$

Then :

$$[\mathbf{m} \ \mathbf{n}]^T \mathbf{Q} = \begin{bmatrix} \mathbf{m}^T \mathbf{P} \\ c \end{bmatrix} \quad (16)$$

solving this equation for the line $\begin{bmatrix} 1 \\ 0 \end{bmatrix}^T \mathbf{x} = 0$, we get :

$$\begin{bmatrix} 0 \\ 2 + \frac{5\sqrt{3}}{2} \end{bmatrix} \quad \text{and} \quad \begin{bmatrix} 0 \\ 2 - \frac{5\sqrt{3}}{2} \end{bmatrix} \quad (17)$$

and solving it for the line $\begin{bmatrix} 0 \\ 1 \end{bmatrix}^T \mathbf{x} = 2$, we get :

$$\begin{bmatrix} \frac{5}{2} \\ 2 \end{bmatrix} \quad \text{and} \quad \begin{bmatrix} -\frac{5}{2} \\ 2 \end{bmatrix} \quad (18)$$
