Question:

Let PQR be a right angled isosceles triangle, right at $P(2, 1)$. If the equation of the line QR is $2x + y = 3$, then the equation representing the pair of lines PQ and PR is

- 1) $3x^2 - 3y^2 + 8xy + 20x + 10y + 25 = 0$ 3) $3x^2 - 3y^2 + 8xy + 10x + 15y + 20 = 0$
 2) $3x^2 - 3y^2 + 8xy - 20x - 10y + 25 = 0$ 4) $3x^2 - 3y^2 - 8xy - 10x - 15y - 20 = 0$

Solution:

Given point is $\mathbf{P} = \begin{pmatrix} 2 \\ 1 \end{pmatrix}$ and given line can be written as

$$\mathbf{n}^\top \mathbf{x} = c \quad (4.1)$$

where, $\mathbf{n} = \begin{pmatrix} 2 \\ 1 \end{pmatrix}$ and $c = 3$.

Parametric form of line through \mathbf{P} is

$$\mathbf{r} = \mathbf{P} + \lambda \mathbf{m} \quad (4.2)$$

Using this, we can represent points Q and R as

$$\mathbf{Q} = \mathbf{P} + \lambda_1 \mathbf{m}_1 \quad (4.3)$$

$$\mathbf{R} = \mathbf{P} + \lambda_2 \mathbf{m}_2 \quad (4.4)$$

where, $\mathbf{m}_1 = \begin{pmatrix} 1 \\ m_1 \end{pmatrix}$ and $\mathbf{m}_2 = \begin{pmatrix} 1 \\ m_2 \end{pmatrix}$ are direction vectors of lines $\mathbf{Q} - \mathbf{P}$ and $\mathbf{R} - \mathbf{P}$, while m_1 and m_2 are the respective slopes.

Given that the lines are perpendicular,

$$\mathbf{m}_1^\top \mathbf{m}_2 = 0 \quad (4.5)$$

$$\implies m_1 m_2 = -1 \quad (4.6)$$

Substituting equation (4.3) in (4.1)

$$\mathbf{n}^\top (\mathbf{P} + \lambda_1 \mathbf{m}_1) = c \quad (4.7)$$

$$\implies \lambda_1 = \frac{c - \mathbf{n}^\top \mathbf{P}}{\mathbf{n}^\top \mathbf{m}_1} \quad (4.8)$$

Substituting the values, we get

$$\lambda_1 = \frac{-2}{2 + m_1} \quad (4.9)$$

Similarly, substituting equation (4.4) in (4.1)

$$\lambda_2 = \frac{c - \mathbf{n}^\top \mathbf{P}}{\mathbf{n}^\top \mathbf{m}_2} \quad (4.10)$$

Substituting values,

$$\lambda_2 = \frac{-2}{2 + m_2} \quad (4.11)$$

$$\Rightarrow \lambda_2 = \frac{-2m_1}{2m_1 - 1} \quad (4.12)$$

Given that the triangle is isosceles,

$$\|\mathbf{Q} - \mathbf{P}\| = \|\mathbf{R} - \mathbf{P}\| \quad (4.13)$$

$$\Rightarrow |\lambda_1| \|\mathbf{m}_1\| = |\lambda_2| \|\mathbf{m}_2\| \quad (4.14)$$

$$\Rightarrow \left| \frac{-2}{2 + m_1} \right| \sqrt{1 + m_1^2} = \left| \frac{-2m_1}{2m_1 - 1} \right| \sqrt{1 + \left(\frac{-1}{m_1} \right)^2} \quad (4.15)$$

$$\Rightarrow \left| \frac{2}{2 + m_1} \right| = \left| \frac{2}{2m_1 - 1} \right| \quad (4.16)$$

Solving the above, we get

$$m_1 = 3 \text{ or } m_1 = \frac{-1}{3} \quad (4.17)$$

Correspondingly,

$$m_2 = \frac{-1}{3} \text{ or } m_2 = 3 \quad (4.18)$$

So, the equations of the two required lines are

$$3x - y - 5 = 0 \text{ and } x + 3y - 5 = 0 \quad (4.19)$$

\therefore Multiplying the above two equations, we get the pair of straight lines to be

$$3x^2 - 3y^2 + 8xy - 20x - 10y + 25 = 0$$
