**Question:** For what value of  $k$  do the following system of equations possess a non trivial solution over the set of rationals  $\mathbb{Q}$ ?

$$x + ky + 3z = 0$$

$$3x + ky - 2z = 0$$

$$2x + 3y - 4z = 0$$

For that value of  $k$ , find all the solutions of the system.

**Solution:**

$$\left( \begin{array}{ccc|c} 1 & k & 3 & 0 \\ 3 & k & -2 & 0 \\ 2 & 3 & -4 & 0 \end{array} \right) \quad (0.1)$$

Apply Gaussian elimination to find the row echelon form.

$$R_2 \rightarrow R_2 - 3R_1:$$

$$R_3 \rightarrow R_3 - 2R_1:$$

$$\left( \begin{array}{ccc|c} 1 & k & 3 & 0 \\ 0 & k - 3k & -2 - 9 & 0 \\ 0 & 3 - 2k & -4 - 6 & 0 \end{array} \right) \quad (0.2)$$

$$\left( \begin{array}{ccc|c} 1 & k & 3 & 0 \\ 0 & -2k & -11 & 0 \\ 0 & 3 - 2k & -10 & 0 \end{array} \right) \quad (0.3)$$

For a non-trivial solution, the rank of this coefficient matrix  $A$  must be less than the 3.

If  $-2k = 0$ , then  $k = 0$ . In this case, the matrix becomes:

$$\left( \begin{array}{ccc|c} 1 & 0 & 3 & 0 \\ 0 & 0 & -11 & 0 \\ 0 & 3 & -10 & 0 \end{array} \right) \quad (0.4)$$

This matrix has rank 3, which would lead to only the trivial solution. So  $k \neq 0$ .

If  $k \neq 0$ , we can proceed:

$$R_2 \rightarrow -R_2:$$

$$\left( \begin{array}{ccc|c} 1 & k & 3 & 0 \\ 0 & 2k & 11 & 0 \\ 0 & 3 - 2k & -10 & 0 \end{array} \right) \quad (0.5)$$

$$R_3 \rightarrow 2kR_3 - (3 - 2k)R_2:$$

$$\left( \begin{array}{ccc|c} 1 & k & 3 & 0 \\ 0 & 2k & 11 & 0 \\ 0 & 0 & 2k - 33 & 0 \end{array} \right) \quad (0.6)$$

For a non-trivial solution, the rank of A must be less than 3, meaning the (3,3) element in the row echelon form must be zero.

$$2k - 33 = 0 \quad (0.7)$$

$$2k = 33 \quad (0.8)$$

$$k = \frac{33}{2} \quad (0.9)$$

The augmented matrix for  $k = \frac{33}{2}$ :

$$\left( \begin{array}{ccc|c} 1 & 33/2 & 3 & 0 \\ 3 & 33/2 & -2 & 0 \\ 2 & 3 & -4 & 0 \end{array} \right) \quad (0.10)$$

$$R_2 \rightarrow R_2 - 3R_1:$$

$$\left( \begin{array}{ccc|c} 1 & 33/2 & 3 & 0 \\ 0 & -33 & -11 & 0 \\ 2 & 3 & -4 & 0 \end{array} \right) \quad (0.11)$$

$$R_3 \rightarrow R_3 - 2R_1:$$

$$\left( \begin{array}{ccc|c} 1 & 33/2 & 3 & 0 \\ 0 & -33 & -11 & 0 \\ 0 & -30 & -10 & 0 \end{array} \right) \quad (0.12)$$

$$R_2 \rightarrow R_2/(-11):$$

$$R_3 \rightarrow R_3/(-10):$$

$$\left( \begin{array}{ccc|c} 1 & 33/2 & 3 & 0 \\ 0 & 3 & 1 & 0 \\ 0 & 3 & 1 & 0 \end{array} \right) \quad (0.13)$$

$$R_3 \rightarrow R_3 - R_2:$$

$$\left( \begin{array}{ccc|c} 1 & 33/2 & 3 & 0 \\ 0 & 3 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right) \quad (0.14)$$

The rank of the coefficient matrix is 2, which is less than 3, so there are non-trivial solutions.

From the second row:  $3y + z = 0 \Rightarrow z = -3y$ .

From the first row:  $x + \frac{33}{2}y + 3z = 0$

Substitute  $z = -3y$ :  $x = -\frac{15}{2}y$ .

Let  $y = 2t$  Then  $x = -\frac{15}{2}(2t) = -15t$ . And  $z = -3(2t) = -6t$ .

The solutions are of the form:  $\begin{pmatrix} x \\ y \\ z \end{pmatrix} = t \begin{pmatrix} -15 \\ 2 \\ -6 \end{pmatrix}$  for any  $t \in \mathbb{Q}$ .
