## Question (2.7.3)

If  $\mathbf{a}$  and  $\mathbf{b}$  are two vectors such that  $\mathbf{a} = \hat{i} - \hat{j} + \hat{k}$ ,  $\mathbf{b} = 2\hat{i} - \hat{j} - 3\hat{k}$ , then find the vector  $\mathbf{c}$ , given that  $\mathbf{a} \times \mathbf{c} = \mathbf{b}$ ,  $\mathbf{a} \cdot \mathbf{c} = 4$ .

# Solution

$$\mathbf{a} = \begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix} \quad \mathbf{b} = \begin{pmatrix} 2 \\ -1 \\ -3 \end{pmatrix} \quad \mathbf{c} = \begin{pmatrix} c_1 \\ c_2 \\ c_3 \end{pmatrix} \quad (1)$$

$$\mathbf{a} \times \mathbf{c} = \mathbf{b} \quad (2)$$

$$\implies \mathbf{c} \perp \mathbf{b} \quad (3)$$

$$\therefore \mathbf{b}^T \mathbf{c} = 0 \quad (4)$$

# Solution

and  $\mathbf{a}^\top \mathbf{c} = 4$  is given

$$(\mathbf{a} \ \mathbf{b})^\top \mathbf{c} = \begin{pmatrix} 4 \\ 0 \end{pmatrix} \quad (5)$$

$$\begin{pmatrix} 1 & -1 & 1 \\ 2 & -1 & -3 \end{pmatrix} \mathbf{c} = \begin{pmatrix} 4 \\ 0 \end{pmatrix} \quad (6)$$

$$\mathbf{c} = \begin{pmatrix} -4 \\ -8 \\ 0 \end{pmatrix} + \lambda \begin{pmatrix} 4 \\ 5 \\ 1 \end{pmatrix} \quad (7)$$

This satisfies all the given conditions when  $\lambda = 1$

Thus,

$$\mathbf{c} = \begin{pmatrix} 0 \\ -3 \\ 1 \end{pmatrix} \quad (8)$$
