Problem

Slope of a line passing through $\mathbf{P}\,(2,3)$ and intersecting the line $x+y=7$ at a distance of 4 units from $\mathbf{P}$, is

Finding values

Given

$$\mathbf{P} = \begin{pmatrix} 2 \\ 3 \end{pmatrix} \tag{2.1}$$

Equation of a line through $\mathbf{P}$ and having slope m is

$$\begin{pmatrix} -m & 1 \end{pmatrix} \begin{pmatrix} x-2 \\ y-3 \end{pmatrix} = 0 \tag{2.2}$$

$$\begin{pmatrix} -m & 1 \end{pmatrix} \left(\begin{pmatrix} x \\ y \end{pmatrix} - \begin{pmatrix} 2 \\ 3 \end{pmatrix} \right) \implies \begin{pmatrix} -m & 1 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} -m & 1 \end{pmatrix} \begin{pmatrix} 2 \\ 3 \end{pmatrix} \tag{2.3}$$

$$\begin{pmatrix} -m & 1 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = 3 - 2m \tag{2.4}$$

$$x + y = 7 \implies \begin{pmatrix} 1 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{x} \\ \mathbf{y} \end{pmatrix} = 7 \tag{2.5}$$

Solving

$$\begin{pmatrix} -m & 1 & 3-2m \\ 1 & 1 & 7 \end{pmatrix} \xleftrightarrow{R_1 \leftrightarrow R_2} \begin{pmatrix} 1 & 1 & 7 \\ -m & 1 & 3-2m \end{pmatrix} \tag{2.6}$$

$$\begin{pmatrix} 1 & 1 & 7 \\ -m & 1 & 3-2m \end{pmatrix} \xleftrightarrow{R_2 \to R_2 + mR_1} \begin{pmatrix} 1 & 1 & 7 \\ 0 & 1+m & 3+5m \end{pmatrix} \tag{2.7}$$

$$y = \frac{3+5m}{1+m} \tag{2.8}$$

$$x + y = 7 \implies x = 7 - y \implies x = 7 - \frac{3+5m}{1+m} \tag{2.9}$$

$$x = \frac{7+7m-3-5m}{1+m} = \frac{4+2m}{1+m} \tag{2.10}$$

Given the point is at a distance of 4 units from point **P**

$$\left\| \begin{pmatrix} x \\ y \end{pmatrix} - \begin{pmatrix} 2 \\ 3 \end{pmatrix} \right\| = 4 \implies \left\| \begin{pmatrix} \frac{4+2m}{1+m} - 2 \\ \frac{3+5m}{1+m} - 3 \end{pmatrix} \right\| = 4 \tag{2.11}$$

Substitution

$$\left\|\begin{pmatrix}\frac{4+2m-2-2m}{1+m}\\\frac{3+5m-3-3m}{1+m}\end{pmatrix}\right\| = \left\|\begin{pmatrix}\frac{2}{1+m}\\\frac{2m}{1+m}\end{pmatrix}\right\| = 4 \quad (2.12)$$

$$\sqrt{\left(\frac{2}{1+m}\right)^2 + \left(\frac{2m}{1+m}\right)^2} = 4 \quad (2.13)$$

$$\frac{4+4m^2}{(1+m)^2} = 4^2 = 16 \quad (2.14)$$

$$4\left(1+m^2\right) = 16\left(1+m^2+2m\right) \implies \left(1+m^2\right) = 4\left(1+m^2+2m\right) \quad (2.15)$$

$$4+4m^2+8m = 1+m^2 \implies 3m^2+8m+3 = 0 \quad (2.16)$$

$$m^2+\frac{8m}{3}+1 = 0 \quad (2.17)$$

$$m^2+\frac{8m}{3}+1+\left(\frac{4}{3}\right)^2 = \left(\frac{4}{3}\right)^2 \quad (2.18)$$

Conclusion

$$\left(m + \frac{4}{3}\right)^2 = \frac{16}{9} - 1 = \frac{7}{9} \tag{2.19}$$

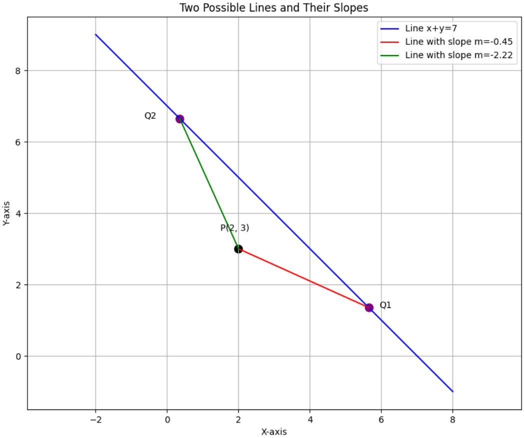
$$m + \frac{4}{3} = \pm\frac{\sqrt{7}}{3} \tag{2.20}$$

$$m = \frac{-4 + \sqrt{7}}{3} \text{ or } \frac{-4 - \sqrt{7}}{3} \tag{2.21}$$

According to options

$$\frac{-4 + \sqrt{7}}{3} = \frac{-8 + 2\sqrt{7}}{6} = \frac{1 - \sqrt{7}}{1 + \sqrt{7}} \tag{2.22}$$

Plot



Two Possible Lines and Their Slopes

C Code

```c
#include <math.h>
void calculate_slope_data(double* out_data) {
    double px = 2.0, py = 3.0;
    double a = 1.0, b = -6.0, c = 2.0;
    double discriminant = sqrt(b*b - 4*a*c);

    double q1_x = (-b + discriminant) / (2 * a); // 3 + sqrt(7)
    double q2_x = (-b - discriminant) / (2 * a); // 3 - sqrt(7)

    double q1_y = 7 - q1_x;
    double q2_y = 7 - q2_x;

    double slope1 = (q1_y - py) / (q1_x - px);
    double slope2 = (q2_y - py) / (q2_x - px);
    out_data[0] = px; out_data[1] = py;
    out_data[2] = q1_x; out_data[3] = q1_y;
    out_data[4] = q2_x; out_data[5] = q2_y;
    out_data[6] = slope1; out_data[7] = slope2;
}
```

Python Code for Calling

```python
import ctypes
import numpy as np

def get_data_from_c():
    lib = ctypes.CDLL('./code.so')

    double_array_8 = ctypes.c_double * 8
    lib.calculate_slope_data.argtypes = [ctypes.POINTER(ctypes.
        c_double)]
    out_data_c = double_array_8()
    lib.calculate_slope_data(out_data_c)
    all_data = np.array(out_data_c)
    # Unpack the data
    point_p = all_data[0:2]
    point_q1 = all_data[2:4]
    point_q2 = all_data[4:6]
    slopes = all_data[6:8]

    return point_p, point_q1, point_q2, slopes
```
