Question c)

Let p be an odd prime number and $\boldsymbol{T_p}$ be the following set of 2×2 matrices

$$\mathbf{T}_{\mathbf{p}} = \left\{ \mathbf{A} = \begin{pmatrix} a & b \\ c & a \end{pmatrix} : a, b, c \in \{0, 1, 2, \dots, p-1\} \right\}$$
 (1)

c) The number of A in T p such that det(A) is not divisible by p is

Solution

Step 1: Trace of A

$$\mathbf{A} = \begin{pmatrix} a & b \\ c & a \end{pmatrix} \tag{2}$$

$$tr(\mathbf{A}) = a + a = 2a \tag{3}$$

$$2a \mod p \not\equiv 0 \tag{4}$$

p is a odd prime, the number 2 is not a multiple of p, so 'a' must also be non-zero,

Therefore the condition simplifies to:

$$a \mod p \not\equiv 0$$
 (5)

Solution

so for a their are p-1 chooses.

Step 2: $det(\mathbf{A}) \mod p \equiv 0$

$$det(\mathbf{A}) = \begin{vmatrix} a & b \\ c & a \end{vmatrix} \tag{6}$$

$$=a^2-bc\tag{7}$$

$$a^2 - bc \mod p \equiv 0 \implies bc \equiv a^2 \pmod p$$
 (8)

'a' as p-1 choices leaving a=0,let $a^2 = k$

$$bc = k(k \neq 0) \tag{9}$$

Solution

neither of 'b' and 'c' be zero for 'b' we have p-1 choices leaving zero

$$bc \equiv k$$
 (10)

$$c \equiv k.b^{-1} (b^{-1}$$
 multiplicative inverse of b modulo p) (11)

so for every 'b' we have 'c'

Therefore their are p-1 pairs of (b,c)

Finally, total number matrix A

$$= (p-1)(p-1) = (p-1)^2$$
 (12)
