### Question

Find the distance of the point  $\left(1,-2,9\right)$  from the point of intersection of the line

$$\mathbf{r} = 4\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 7\hat{\mathbf{k}} + \lambda \left(3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} + 2\hat{\mathbf{k}}\right)$$

and the plane

$$\mathbf{r}\cdot\left(\hat{\mathbf{i}}-\hat{\mathbf{j}}+\hat{\mathbf{k}}\right)=10.$$

#### General Formulation

The line can be written as

$$\mathbf{r} = \mathbf{r}_0 + \lambda \mathbf{d},\tag{1}$$

where  $\mathbf{r}_0$  is a point on the line,  $\mathbf{d}$  is the direction vector.

The plane equation is

$$\mathbf{n}^T \mathbf{r} = c, \tag{2}$$

where  $\mathbf{n}$  is the normal vector and c is a constant.

#### Intersection of Line and Plane

Substitute  $\mathbf{r} = \mathbf{r}_0 + \lambda \mathbf{d}$  into the plane:

$$\mathbf{n}^{T}(\mathbf{r}_{0} + \lambda \mathbf{d}) = c \tag{3}$$

$$\implies \lambda = \frac{c - \mathbf{n}^T \mathbf{r}_0}{\mathbf{n}^T \mathbf{d}}.$$
 (4)

The intersection point is

$$\mathbf{P} = \mathbf{r}_0 + \frac{c - \mathbf{n}^T \mathbf{r}_0}{\mathbf{n}^T \mathbf{d}} \mathbf{d}. \tag{5}$$

### Distance Formula

Let the external point be A.

Then displacement vector is

$$\mathbf{v} = \mathbf{P} - \mathbf{A} \tag{6}$$

$$\mathbf{v} = \mathbf{r}_0 + \frac{c - \mathbf{n}^T \mathbf{r}_0}{\mathbf{n}^T \mathbf{d}} \mathbf{d} - \mathbf{A}. \tag{7}$$

Thus the required distance is

$$d = \|\mathbf{v}\| = \sqrt{\mathbf{v}^T \mathbf{v}}.\tag{8}$$

# Substitution from Question

#### From the question:

$$\mathbf{r}_0 = \begin{pmatrix} 4 \\ 2 \\ 7 \end{pmatrix}, \qquad \qquad \mathbf{d} = \begin{pmatrix} 3 \\ 4 \\ 2 \end{pmatrix}, \qquad \qquad (9)$$

$$\mathbf{n} = \begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix},$$

$$c=10, (10)$$

$$\mathbf{A} = \begin{pmatrix} 1 \\ -2 \\ 9 \end{pmatrix}.$$

### Substitution from Question

#### Compute:

$$\mathbf{n}^{T}\mathbf{d} = \begin{pmatrix} 1 & -1 & 1 \end{pmatrix} \begin{pmatrix} 3 \\ 4 \\ 2 \end{pmatrix} = 1, \tag{12}$$

$$\mathbf{n}^{T}\mathbf{r}_{0} = \begin{pmatrix} 1 & -1 & 1 \end{pmatrix} \begin{pmatrix} 4 \\ 2 \\ 7 \end{pmatrix} = 9, \tag{13}$$

$$\lambda = \frac{10 - 9}{1} = 1. \tag{14}$$

### Final Calculation

Intersection point:

$$\mathbf{P} = \begin{pmatrix} 4 \\ 2 \\ 7 \end{pmatrix} + 1 \cdot \begin{pmatrix} 3 \\ 4 \\ 2 \end{pmatrix} = \begin{pmatrix} 7 \\ 6 \\ 9 \end{pmatrix}. \tag{15}$$

Displacement:

$$\mathbf{v} = \mathbf{P} - \mathbf{A} = \begin{pmatrix} 7 \\ 6 \\ 9 \end{pmatrix} - \begin{pmatrix} 1 \\ -2 \\ 9 \end{pmatrix} = \begin{pmatrix} 6 \\ 8 \\ 0 \end{pmatrix}. \tag{16}$$

Distance:

$$d = \sqrt{6^2 + 8^2 + 0^2} = \sqrt{100} = 10. \tag{17}$$

### Conclusion

**Final Answer:** The required distance is

10

### C Code

```
#include <stdio.h>
#include <math.h>
// Function to compute distance between A(1,-2,9) and P(7,6,9)
double compute_distance() {
   double A[3] = \{1, -2, 9\};
   double P[3] = \{7, 6, 9\};
   double v[3];
   double sum = 0.0;
   for(int i=0; i<3; i++) {</pre>
       v[i] = P[i] - A[i];
       sum += v[i]*v[i];
    }
    return sqrt(sum);
```

# Python Code (C Shared Library)

```
import ctypes
# Load the shared C library
lib = ctypes.CDLL(./points.so)
# Specify return type
lib.compute distance.restype = ctypes.c double
# Call the C function
distance = lib.compute distance()
print(Distance from (1,-2,9) to intersection point (7,6,9):,
   distance)
```

# Python Code (Visualization)

```
import numpy as np
 import matplotlib.pyplot as plt
 # Given point
 A = np.array([1, -2, 9])
 # Line: r = r0 + lambda*d
 |r0 = np.array([4, 2, 7])
 d = np.array([3, 4, 2])
 lambda_vals = np.linspace(-1, 2, 100)
 line points = r0.reshape(3,1) + d.reshape(3,1) * lambda vals
 # Intersection point
 P = r0 + d
# Plane: x - y + z = 10
 x plane = np.linspace(-5, 10, 20)
 y plane = np.linspace(-5, 10, 20)
```

## Python code

```
X, Y = np.meshgrid(x plane, y plane)
Z = 10 - X + Y
fig = plt.figure()
ax = fig.add_subplot(111, projection='3d')
# Plot plane
ax.plot surface(X, Y, Z, alpha=0.3, color='cyan', rstride=1,
    cstride=1, edgecolor='none')
# Plot line
ax.plot(line_points[0,:], line_points[1,:], line_points[2,:],
    color='blue', label=Line r=r0+d)
```

# Python code

```
# Plot points
ax.scatter(A[0], A[1], A[2], color='red', s=50, label=Point A
    (1,-2,9)
[ax.scatter(P[0], P[1], P[2], color='green', s=50, label=
    Intersection P(7,6,9)
# Dotted line from A to P
ax.plot([A[0], P[0]], [A[1], P[1]], [A[2], P[2]], color='magenta'
    , linestyle='--', label=Distance d)
ax.set xlabel('X-axis')
ax.set_ylabel('Y-axis')
ax.set_zlabel('Z-axis')
ax.set_title(Distance from Point to Line-Plane Intersection)
ax.legend()
plt.show()
```
