Question

Let two non-collinear unit vectors \hat{a} and \hat{b} form an acute angle. A point \mathbf{P} moves so that at any time t the position vector \mathbf{P} (where \mathbf{O} is the origin) is given by $\mathbf{a}\cos t + \mathbf{b}\sin t$. When \mathbf{P} is farthest from origin \mathbf{O} , let M be the length of \mathbf{P} and $\hat{\mathbf{u}}$ be the unit vector along \mathbf{P} . Then,

$$\mathbf{0} \ \hat{\mathbf{u}} = \frac{\mathbf{a} + \mathbf{b}}{|\mathbf{a} + \mathbf{b}|} \text{ and } M = (1 + \mathbf{a} \cdot \mathbf{b})^{\frac{1}{2}}$$

$$\hat{\mathbf{u}} = \frac{\mathbf{a} - \mathbf{b}}{|\mathbf{a} - \mathbf{b}|} \text{ and } M = (1 + \mathbf{a} \cdot \mathbf{b})^{\frac{1}{2}}$$

3
$$\hat{\mathbf{u}} = \frac{\mathbf{a} + \mathbf{b}}{|\mathbf{a} + \mathbf{b}|}$$
 and $M = (1 + 2\mathbf{a} \cdot \mathbf{b})^{\frac{1}{2}}$

$$\mathbf{0} \quad \hat{\mathbf{u}} = \frac{\mathbf{a} - \mathbf{b}}{|\mathbf{a} - \mathbf{b}|} \text{ and } M = (1 + 2\mathbf{a} \cdot \mathbf{b})^{\frac{1}{2}}$$

Equation

Given equation:

$$\mathbf{P} = \mathbf{a}\cos t + \mathbf{b}\sin t \tag{1}$$

Which can be written as:

$$\mathbf{P} = \begin{pmatrix} \mathbf{a} & \mathbf{b} \end{pmatrix} \begin{pmatrix} cost \\ sint \end{pmatrix} \tag{2}$$

Let

$$\mathbf{x} = \begin{pmatrix} cost \\ sint \end{pmatrix}$$
 and $\mathbf{G} = \begin{pmatrix} 1 & (\mathbf{a})^T(\mathbf{b}) \\ (\mathbf{a})^T(\mathbf{b}) & 1 \end{pmatrix}$ (3)

From given if ${\bf P}$ is farthest from origin , then length of ${\bf P}$ is given as M.From this we can say that

$$M = \max \|\mathbf{P}\| \tag{4}$$

Now,

$$\|\mathbf{P}\| = \sqrt{(\mathbf{P})^T(\mathbf{P})} \tag{5}$$

$$\|\mathbf{P}\| = \sqrt{\left(\begin{pmatrix} \mathbf{a} & \mathbf{b}\end{pmatrix}\begin{pmatrix} cost\\ sint\end{pmatrix}\right)^T \left(\begin{pmatrix} \mathbf{a} & \mathbf{b}\end{pmatrix}\begin{pmatrix} cost\\ sint\end{pmatrix}\right)}$$
(6)

$$\|\mathbf{P}\| = \sqrt{\begin{pmatrix} cost \\ sint \end{pmatrix}^T \begin{pmatrix} \mathbf{a} & \mathbf{b} \end{pmatrix}^T \begin{pmatrix} \mathbf{a} & \mathbf{b} \end{pmatrix} \begin{pmatrix} cost \\ sint \end{pmatrix}}$$
 (7)

$$\|\mathbf{P}\| = \sqrt{\|\mathbf{a}\|^2 \cos^2 t + \|\mathbf{b}\|^2 \sin^2 t + 2(\mathbf{a})^T (\mathbf{b})(\cos t)(\sin t)}$$
 (8)

$$\|\mathbf{P}\|^2 = \begin{pmatrix} cost & sint \end{pmatrix} \begin{pmatrix} 1 & (\mathbf{a})^T(\mathbf{b}) \\ (\mathbf{a})^T(\mathbf{b}) & 1 \end{pmatrix} \begin{pmatrix} cost \\ sint \end{pmatrix}$$
(9)

From Eq.3

$$\|\mathbf{P}\|^2 = \mathbf{x}^T \mathbf{G} \mathbf{x} \tag{10}$$

Now we should find the maximum value of $x^T G x$ such that $\|x\| = 1$

By **Rayleigh-Ritz theorem**, the maximum value of the quadratic form if \mathbf{x} is a unit vector will be the largest eigenvalue (λ_{max}) of the matrix \mathbf{G} . So,

$$\max \|\mathbf{P}\| = \sqrt{\lambda_{max}} \tag{11}$$

Now we will calculate the Eigen value for the matrix G:

$$\left|G - \lambda I\right| = 0\tag{12}$$

$$\left| \begin{pmatrix} 1 - \lambda & (\mathbf{a})^{\mathsf{T}}(\mathbf{b}) \\ (\mathbf{a})^{\mathsf{T}}(\mathbf{b}) & 1 - \lambda \end{pmatrix} \right| = 0$$
 (13)

$$(1 - \lambda)^2 - ((\mathbf{a})^T(\mathbf{b}))^2 = 0$$
 (14)

$$1 - \lambda = (\mathbf{a})^{T}(\mathbf{b}) \text{ or } 1 - \lambda = -(\mathbf{a})^{T}(\mathbf{b})$$
 (15)

$$\lambda = 1 + (\mathbf{a})^T (\mathbf{b}) \text{ or } \lambda = 1 - (\mathbf{a})^T (\mathbf{b})$$
 (16)

It is already given that $(\mathbf{a})^T(\mathbf{b}) > 0(\mathbf{a} \text{ and } \mathbf{b} \text{ form an acute angle})$. so,

$$\lambda_{max} = 1 + (\mathbf{a})^T (\mathbf{b}) \tag{17}$$

From Eq.9

$$\max \|\mathbf{P}\| = \sqrt{1 + (\mathbf{a})^T(\mathbf{b})}$$
 (18)

The above equation can be written as

$$\max \|\mathbf{P}\| = \sqrt{1 + \mathbf{a.b}} \tag{19}$$

From Eq.4:

$$M = \sqrt{1 + \mathbf{a.b}} \tag{20}$$

Now let us find the value of t for which $\|\mathbf{P}\|$ is max

With eigenvalue equation, We'll use matrix G and largest eigenvalue λ_{max} such that,

$$(G - \lambda I) x = 0 (21)$$

$$\begin{pmatrix} -(\mathbf{a})^{T}(\mathbf{b}) & (\mathbf{a})^{T}(\mathbf{b}) \\ (\mathbf{a})^{T}(\mathbf{b}) & -(\mathbf{a})^{T}(\mathbf{b}) \end{pmatrix} \begin{pmatrix} cost \\ sint \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$
 (22)

By solving this we'll get

$$cost = sint$$
 (23)

We already know that:

$$\sin^2 t + \cos^2 t = 1 \tag{24}$$

So,

$$sint = \frac{1}{\sqrt{2}}$$
 and $cost = \frac{1}{\sqrt{2}}$ (25)

From above result

$$t = \frac{\pi}{4} \tag{26}$$

Now unit vector \mathbf{u} along \mathbf{P} is given by:

$$\mathbf{u} = \frac{\mathbf{P}}{\|\mathbf{P}\|} \tag{27}$$

$$\mathbf{u} = \frac{\mathbf{a}\cos t + \mathbf{b}\sin t}{\|\mathbf{a}\cos t + \mathbf{b}\sin t\|}$$
 (28)

Now subtituiting the value of t in above equation:

$$\mathbf{u} = \frac{\mathbf{a} \frac{1}{\sqrt{2}} + \mathbf{b} \frac{1}{\sqrt{2}}}{\left\| \mathbf{a} \frac{1}{\sqrt{2}} + \mathbf{b} \frac{1}{\sqrt{2}} \right\|}$$
(29)

$$\mathbf{u} = \frac{\mathbf{a} + \mathbf{b}}{\|\mathbf{a} + \mathbf{b}\|} \tag{30}$$

From Eq.18 and Eq.28 (a) is correct

C Code

```
#include <stdio.h>
#include <math.h>
// Dot product of two 2D vectors
double dot(double a[], double b[]) {
   return a[0]*b[0] + a[1]*b[1];
// Magnitude of a 2D vector
double magnitude(double a[]) {
   return sqrt(dot(a, a));
// Compute max length M and unit vector u using matrix method
void compute(double a[], double b[], double *M, double u[]) {
   double c = dot(a, b); // a b
    *M = sqrt(1 + c); // largest eigenvalue's sqrt
```

C Code

```
// Direction = a + b
double temp[2] = {a[0] + b[0], a[1] + b[1]};
double norm = magnitude(temp);
u[0] = temp[0] / norm;
u[1] = temp[1] / norm;
}
```

Python Code

```
import ctypes
import numpy as np
import matplotlib.pyplot as plt
# Load shared library
lib = ctypes.CDLL(./vec.so) # use vec.dll on Windows
# Define argument & return types
lib.compute.argtypes = [
   np.ctypeslib.ndpointer(dtype=np.double, ndim=1, flags=
       C CONTIGUOUS).
   np.ctypeslib.ndpointer(dtype=np.double, ndim=1, flags=
       C CONTIGUOUS),
   ctypes.POINTER(ctypes.c double),
   np.ctypeslib.ndpointer(dtype=np.double, ndim=1, flags=
       C CONTIGUOUS)
```

Python Code

```
# Example vectors
a = np.array([1.0, 0.0], dtype=np.double)
b = np.array([0.6, 0.8], dtype=np.double)
M = ctypes.c_double()
u = np.zeros(2, dtype=np.double)
# Call C function
lib.compute(a, b, ctypes.byref(M), u)
print(From C library:)
print(M =, M.value)
print(u =, u)
# Plot in same style as attachment
0 = np.array([0.0, 0.0])
P = u * M.value
```

Python Code

```
|plt.plot([0[0], P[0]], [0[1], P[1]], 'b-', label=Vector OP)
 plt.scatter(*0, color=red, s=100, label=0(0,0))
 plt.scatter(*P, color=green, s=100, label=fP({P[0]:.2f},{P[1]:.2f
     }))
 plt.scatter(u, color=purple, marker=, s=200, label=fu({u[0]:.2f
     }.{u[1]:.2f}))
plt.axhline(0, color='black')
 plt.axvline(0, color='black')
 plt.legend()
 plt.title(Figure)
 plt.savefig(/media/indhiresh-s/New Volume/Matrix/ee1030-2025/
     ee25btech11027/MATGEO/2.10.56/figs/figure1.png)
 plt.show()
```
