Ouestion:

The edges of a parallelopiped are of unit length and are parallel to non-coplanar unit vectors $\hat{a}, \hat{b}, \hat{c}$ such that $\hat{a}.\hat{b} = \hat{b}.\hat{c} = \hat{c}.\hat{a} = \frac{1}{2}$. Then, the volume of the parallelopiped is

1)
$$\frac{1}{\sqrt{2}}$$

2)
$$\frac{1}{2\sqrt{2}}$$
 3) $\frac{\sqrt{3}}{2}$

3)
$$\frac{\sqrt{3}}{2}$$

4)
$$\frac{1}{\sqrt{3}}$$

1

Solution:

Let us solve the given equation theoretically and then verify the solution computationally.

According to the question, the edges of the parallelopiped are parallel to the unit vectors $\hat{a}, \hat{b}, \hat{c}$ and

$$\hat{a}^T \hat{b} = \hat{b}^T \hat{c} = \hat{c}^T \hat{a} = \frac{1}{2}$$

As we know that the volume of parallelopiped is given by

$$V = [\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$$

and

$$[\mathbf{a} \ \mathbf{b} \ \mathbf{c}][\mathbf{a} \ \mathbf{b} \ \mathbf{c}]^T = \mathbf{G}$$

where **G** is the Gram Matrix.

$$\therefore \mathbf{G} = \begin{pmatrix} \hat{a}^T \hat{a} & \hat{a}^T \hat{b} & \hat{a}^T \hat{c} \\ \hat{b}^T \hat{a} & \hat{b}^T \hat{b} & \hat{b}^T \hat{c} \\ \hat{c}^T \hat{a} & \hat{c}^T \hat{b} & \hat{c}^T \hat{c} \end{pmatrix} = \begin{pmatrix} 1 & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & 1 & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & 1 \end{pmatrix}$$

For calculating the det(G), we can use the concept of eigen values.

Eigen values are those scalars which satisfies the following condition, For any non-zero eigen-vector v and coefficient matrix M,

 $\mathbf{M}\mathbf{v} = \lambda \mathbf{v}$, where λ is an eigen value.

$$\mathbf{G} = (1 - \rho)\mathbf{I} + \rho \mathbf{1}\mathbf{1}^T$$
, where $\rho = \frac{1}{2}$ and $\mathbf{1} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$

Let $\mathbf{1}\mathbf{1}^T = \mathbf{J}$. As we could see that the eigen-vector of \mathbf{J} is $\mathbf{1}$ and by the rule,

$$\begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} = \begin{pmatrix} 3 \\ 3 \\ 3 \end{pmatrix} = 31$$

So, 3 is a eigen value of **J**. Also, we know that the sum of eigen values is equal to trace of a matrix, we can say that the sum of the other eigen values would be 0. Also, we know that any orthogonal vector to $\mathbf{1}$, say $\begin{pmatrix} -1 & 1 & 0 \end{pmatrix}^T$,

$$\begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} -1 \\ 1 \\ 0 \end{pmatrix} = \mathbf{0}$$

yields 0. Thus we can say that 0 is also one of the eigen value of J. As sum of the other eigen values other than 3 is zero, the other eigen value must be zero.

 \therefore eigen values of **J** are $\{3,0,0\}$

Modifying the above equation on **G**,

$$\therefore \mathbf{G}\mathbf{v} = \frac{1}{2}\mathbf{I}\mathbf{v} + \frac{1}{2}\mathbf{J}\mathbf{v}$$

$$\implies$$
 Gv = $\frac{(1+\mu)}{2}$ **v**

where μ is the eigen value of **J**. Here the eigen value of **G** is $\frac{1+\mu}{2}$ and substituting the obtained eigen values of **J** in this equation, we get the eigen values of **G** to be $\{2, \frac{1}{2}, \frac{1}{2}\}$

As we know that for eigen values of **G** being $\{\mu_1, \mu_2, \mu_3\}$,

$$det(\mathbf{G}) = \mu_1 \mu_2 \mu_3$$

$$\therefore det(\mathbf{G}) = 2 \times \frac{1}{2} \times \frac{1}{2} = \frac{1}{2}$$

$$\implies V = \sqrt{det(\mathbf{G})} = \frac{1}{\sqrt{2}} \text{ units}$$

From the figure, taking an example of vectors \mathbf{a} and \mathbf{b} , it is clearly verified that the theoretical solution matches with the computational solution.
